

Introduction

LIKWID is simple to use tool suite of command line applications for performance-oriented programming. It currently works for Intel, AMD, ARM and POWER processors and Nvidia/Rocm GPUs on the Linux OS.

- **likwid-topology** Print the node topology, including cache information, NUMA structure, and the mapping of hardware threads to resources
- likwid-pin Pin threaded applications (POSIX threads and all threading models built on pthreads, such as Intel and GCC OpenMP) to dedicated processors
- likwid-mpirun Wrapper for starting MPI/Hybrid MPI/OpenMP applications with likwid-perfctr integration
- likwid-perfctr Count hardware performance events, including energy, in wrapper, timeline, or stethoscope mode; works with marker API to restrict counting to code regions; includes likwid-pin functionality
- **likwid-perfscope** Frontend to the timeline mode of likwid-perfctr, plots live graphs of performance metrics using gnuplot
- likwid-powermeter Read out RAPL Energy information and get info about Turbo Mode steps: can be used for end-to-end energy measurements
- **likwid-bench** Microbenchmarking platform; allows easy design of multithreaded assembly language benchmarking loops with full affinity control
- likwid-setFrequencies Control the HW threads and Uncore frequencies, set the scaling governor

likwid-genTopoCfg Dump topology information to a file

Download, Build and Install

You can get the releases of LIKWID at: http://ftp.fau.de/likwid/ or https://github.com/RRZE-HPC/likwid/releases For build and installation hints see the INSTALL file or the build instructions in the Wiki: https://github.com/RRZE-HPC/likwid/wiki/Build

Contact

If you have any questions about LIKWID, please open a topic at https://groups.google.com/forum/#!forum/likwid-users.

If you think you found a bug, please open an issue with as much information as possible: https://github.com/RRZE-HPC/likwid/issues.

Generic options (all tools)

-h, --help Help message Version information -v. --version

likwid-topology

| Syntax: | likwid-topology [options] |
|----------------------------|------------------------------|
| -V,verbose <level></level> | Set verbosity |
| -c,caches | List cache information |
| -C,clock | Measure processor clock |
| -G,gpus | List GPU information |
| -0 | CSV output |
| -o,output <file></file> | Store output to file |
| -g | Graphical output (ASCII art) |

likwid-pin

-c E:N:120:2:4

| Syntax: | likwid-pin | [options] your_binary [args] |
|---|--------------------|--|
| -V,verbo | se <level></level> | Verbose output |
| -i | | Set NUMA interleave policy across domains selected by -c |
| -m | | Set NUMA membind policy across domains selected by -c |
| -S,sweep | | Sweep memory & LLC of involved NUMA nodes |
| -c, -C <lis< th=""><th>st></th><th>Specify JW thread ID list</th></lis<> | st> | Specify JW thread ID list |
| -s,skip | <hex></hex> | Bitmask with threads to skip |
| - p | | Print available domains with mapping on physical IDs |
| -d <string></string> | • | Delimiter in physical processor list |
| -q,quiet | ; | Silent without output |
| Example: pl | hysical number | ring (as in likwid-topology) |
| -c 7,4,12-1 | L4 | HWThreads 7, 4, 12, 13, and 14 |
| Examples: I | ogical number | ing (physical hwthreads first) |
| -c S1:0-3 | | First four physical hwthreads on socket 1 |
| -c M0:0-3@N | 11:0-3 | First four physical hwthreads each on NUMA domains 0 and 1 |
| -c M:scatte | er | Scattered binding, physical hwthreads first, across all NUMA domains |
| Examples: | expression syn | tax (compact numbering) |
| | | |

Pin 120 threads in chunks of 2 with

stride 4 in whole node

| Cumtavi 1:1 :1 : | F +: 3 F 1: F 33 |
|--|---|
| • | [options] [your_binary [args]] |
| -V,verbose <level></level> | Verbose output |
| -c <list></list> | HWThread IDs to count events on. |
| -C <list></list> | Like -c but also pin threads |
| -G <list></list> | List of CUDA GPUs to monitor |
| -G <list></list> | List of ROCm GPUs to monitor |
| -g,group <string></string> | CPU performance group or custom event |
| -W,cudagroup <string></string> | CUDA performance group or custom event |
| -R,rocmgroup <string></string> | ROCM performance group or custom event |
| -H | Get group help |
| -s,skip <hex></hex> | Bitmask with threads to skip for pinning |
| -M <0 1> | Set how MSR registers are accessed |
| -a | List available performance groups |
| - e | List available events & counter registers |
| -E <string></string> | List available events & corresponding counters that match <string></string> |
| -i,info | Print CPU info |
| -T <time></time> | Switch to next event set after < time> |
| -f,force | Force overwrite of in-use registers |
| Modes: | |
| -S <time></time> | Stethoscope mode with duration (in s or ms) |
| -t <time></time> | Timeline mode, measure after <time></time> |
| -m,marker | Recognize LIKWID markers in code |
| Output options: | |
| -o,output <file></file> | Store output to file |
| -0 | CSV output |
| stats | Always print statistics table |
| Event set syntax (multiple | -g options allowed): |
| -g <group></group> | Count performance group |
| -g <event>:<counter></counter></event> | Count event <event> with counter <counter></counter></event> |
| -g <e1>:<c1>,<e2>:<c2>,</c2></e2></c1></e1> | . Combine multiple events using ',' |
| -g <event>:<counter>:<op< td=""><td>ot> Count <event> with <counter></counter></event></td></op<></counter></event> | ot> Count <event> with <counter></counter></event> |

and additional option <opt>

likwid-setFrequencies Syntax: likwid-setFrequencies [options] Domain to apply settings to (default all) -c <dom> Set governor (conservative, ondemand, -g <gov> powersave, performance, turbo) Set fixed core frequency (min/cur/max), -f, --freq <f> implicitly sets userspace governor -t, --turbo <0|1> (De-)activate turbo mode -x, --min <f> Set min core frequency -y, --max <f> Set max core frequency --umin <f> Set min Uncore frequency --umax <f> Set max Uncore frequency Print current frequencies -p -1 List available frequencies List available governors Reset CPUs to min/max frequencies with -reset disabled Turbo Reset Uncore to min/max frequencies -ureset

likwid-bench

| Syntax: | likwid-bench [options] | |
|--------------------|---|--|
| -a | List all available benchmark kernels | |
| -d | Delimiter used for physical hwthread list | |
| - p | List available thread domains | |
| -s <time></time> | Minimum time to run the test [sec] | |
| -i <iters></iters> | Specify the number of iterations per thread manually. | |
| -1 <test></test> | List properties of benchmark | |
| -t <test></test> | Type of test | |
| -w <group></group> | <pre>Specify thread group: <dom>:<size>[:<nthreads>[:<chunk>:<stride>]] [-<streamid>:<dom_id>[:<offset>]] <size> in kB, MB or GB</size></offset></dom_id></streamid></stride></chunk></nthreads></size></dom></pre> | |
| -W <group></group> | Like $-w$ but with thread-local initialization (no stream placement with $-$) | |
| | | |

Example: STREAM Triad, AVX w/FMA, 4 hwthreads in socket 0

likwid-bench -t stream_avx_fma -w S0:100MB:4:1:2 Example: load-only, AVX-512, 64 hwthreads, 2 threads/core

likwid-bench -t load_avx512 -w N:28MB:64:2:4

Example: cross-NUMA STREAM Copy

likwid-bench -t copy -w M0:100MB:7:1:2-0:M1,1:M1

MarkerAPI

Instrument code region for C/C++. Get MarkerAPI macros from LIKWID header kwid-marker.h>. Link code to the LIKWID library and define LIKWID_PERFMON during build.

| Macro: | Comment |
|-------------------------------------|---|
| LIKWID_MARKER_INIT* | Initialize LIKWID Marker API. |
| LIKWID_MARKER_THREADINIT | Add thread to Marker API |
| LIKWID_MARKER_START(tag) | Start code region named tag (string) |
| LIKWID_MARKER_STOP(tag) | Stop code region named tag |
| LIKWID_MARKER_CLOSE* | Finalize LIKWID Marker API. |
| Optional Macro: | Comment |
| LIKWID_MARKER_REGISTER(tag) | Register code region identifier tag (less START overhead) |
| LIKWID_MARKER_GET(tag) | Get results for code region tag |
| LIKWID_MARKER_SWITCH* | Switch to next event set |
| * must be called in a serial region | |

Markers are recognized if the application is wrapped by likwid-perfctr with the -m option. For Nvidia GPUs, use LIKWID_NVMARKER... and -DLIKWID_NVMON. For AMD GPUS, use ROCMON_MARKER... and DLIKWID_ROCMON

likwid-powermeter

| Syntax: likwid-powermeter | [options] [your_binary [args]] |
|----------------------------|--|
| -V,verbose <level></level> | Verbose output |
| -M <0 1> | Set how MSR registers are accessed |
| -c <list></list> | Specify socket(s) to measure on |
| -i,info | Print power-related processor info |
| -s <time></time> | Measure for specified time |
| -р | Print dynamic clocking & CPI values (uses likwid-perfctr with ENERGY group) |
| -t | Print current core temperatures [°C] |
| -f | Print current core temperatures [°F] |
| | |

When used as a wrapper, likwid-powermeter does not do any pinning of application threads.

likwid-genTopoCfg

| Syntax: | likwid-genTopoCfg [options] |
|-------------------------|--------------------------------------|
| -o,output <file></file> | Use <file> instead of default</file> |

| ikwid-mp | oirun | |
|--|----------------------|--|
| Syntax: | likwid-mpirun | [options] your_binary [args] |
| -d,deb | ug | Debugging output |
| -n, -np < | count> | Set the number of processes |
| -nperdoma <domain>:</domain> | | Set the number of processes per node by affinity domain and count; see likwid-pin for domains |
| pin <li< td=""><td>st></td><td>Specify pinning of threads</td></li<> | st> | Specify pinning of threads |
| -d,dist <count>(:</count> | | Specify distance between MPI processes. <order>: 'close' or 'spread'.</order> |
| -t,-tpp < | count> | Specify threads per process |
| -s,ski | p <hex></hex> | Bitmask with threads to skip |
| mpi <id< td=""><td>></td><td>Specify which MPI should be used</td></id<> | > | Specify which MPI should be used |
| omp <id< td=""><td>></td><td>Specify which OpenMP should be used</td></id<> | > | Specify which OpenMP should be used |
| hostfil | е | Use custom hostfile |
| -g,gro | up <string></string> | Activate event counting; see likwid- perfctr |
| -m,mar | ker | Activate marker API mode |
| -0 | | CSV output |
| -f,for | ce | Force overwrite of in-use registers |
| Example: | 2 processes per | host, 1 per socket, 2 threads |
| 2 12 1 2 | | 4 04 0 4 / 1 |

likwid-mpirun -pin S0:0-1_S1:0-1 ./a.out Example: 2 processes per socket, count MEM group

likwid-mpirun -nperdomain S:2 -g MEM ./a.out

likwid-perfscope

| ope [options] your_binary [args] |
|--|
| Verbose output |
| Print all preconfigured plot configurations for the current system. |
| HWThread IDs to count events on |
| Like -c but also pin threads |
| Preconfigured plot group or custom event set string with plot config |
| Update interval (default: 1 s) |
| Force overwrite of in-use registers |
| Print data as it is sent to feedGnuplot |
| Use dump functionality of feedGnuplot. Outputs plot configurations plus data to directly feed to gnuplot |
| Execute command and measurements on remote host using SSH |
| |
